

# Software Architecture (F23)

Make a simple console application calculator that takes the users input, and can calculate single operations with the four basic operators

# Take your calculator to the next level

Create a web API that has four get endpoints.  
The URI for the endpoints should be  
“/api/calculator/<operator>/<number1>/<number2>”

You can use this tutorial for reference, but ignore the  
database interactions using the dbContext:
